Abstract

The rapid growth of quick-commerce platforms in India has transformed consumer purchasing behaviour while raising questions about the economic conditions of platform-based delivery workers. This study examines these two dimensions through a combination of primary survey data and secondary research. Primary data were collected through a structured online questionnaire involving 74 respondents selected through convenience sampling. The survey examined usage frequency, motivations for platform use, spending patterns, unplanned purchases, price perceptions and attitudes towards the industry's economic impact. The findings indicate that 87.8% of respondents reported increased spending after using quick-commerce platforms, while 40.5% reported making unplanned purchases. Convenience, avoidance of travel and product availability emerged as important motivations for platform use. The study also examines gig-worker earnings, working conditions and social-security provisions using published research, industry reports and policy documents. The combined analysis highlights the tension between consumer convenience and the need for fair and sustainable working conditions. However, the survey's small, non-representative sample and reliance on self-reported responses limit the generalisability of its findings. The study concludes that the long-term sustainability of quick commerce depends on balancing consumer benefits, business efficiency and worker welfare.

Research Objectives

The study has three objectives:

1. To examine the relationship between quick-commerce convenience, consumer spending patterns and unplanned purchasing behaviour.
2. To assess the earnings, working conditions and social-security challenges faced by gig and platform workers, with particular attention to quick commerce.

3. To evaluate the economic trade-offs between consumer convenience, platform efficiency and worker welfare.

INTRODUCTION

India's labour market has changed significantly with the rise of the gig and platform economy, in which digital platforms connect consumers with workers for delivery, mobility, domestic and other on-demand services. By offering flexible work, quick income and low entry barriers, platform work has become a source of livelihood for millions, particularly young and urban workers. Consumers benefit from speed and convenience, while platforms scale rapidly by matching supply and demand in real time. This model is often described as an economics of convenience, and its growing share of the workforce makes it an important part of India's economic structure.

Three terms define this field. The Code on Social Security, 2020 (Section 2(35)) defines a gig worker as a person who performs work or participates in a work arrangement and earns from such activities outside of a traditional employer-employee relationship. A platform worker is a subset of gig workers who access other organisations or individuals through an online platform to provide services or solve specific problems in exchange for payment. A delivery rider on Swiggy is a platform worker, while a freelance photographer working through personal contacts is a gig worker but not a platform worker. Platforms, which the Code treats as aggregators, are digital intermediaries or marketplaces that connect a buyer or user of a service with a service provider. Examples include Ola, Uber, Swiggy, Zomato, Urban Company and Amazon. The Code places the funding obligation for gig and platform workers' social security on these aggregators.

However, the sustainability of this model has been challenged by the precarious conditions in which platform workers operate. Because they are classified as independent partners rather than employees, they usually lack assured wages, health cover, accident compensation and pension. Risks such as income volatility, injury and illness are shifted from the firm to the individual. This raises broader concerns about fairness and the legitimacy of a labour market in which economic value is created without corresponding protection.

Recent policy developments show both progress and persistent gaps. The Code gave gig and platform workers their first statutory recognition, and the e-Shram portal has created a national database of unorganised workers. Several states, including Rajasthan, Karnataka, Bihar, Jharkhand and Telangana, have also introduced their

own laws. Yet registration does not automatically translate into benefits, and workers who serve multiple platforms or move across states often find their entitlements fragmented.

Social security in a platform economy is closely linked with equality, dignity and access to basic protection. Where technology determines how work is assigned and paid, failure to deliver benefits in a timely and portable manner creates unequal outcomes between workers and the firms that depend on them. The challenge is therefore not only to expand coverage but to address a governance question involving technical design, institutional coordination and regulatory enforcement.

This study examines the economics of convenience in India's quick-commerce industry through two connected dimensions: consumer behaviour and gig-worker welfare. The first research question is investigated using primary data collected through a structured online survey, which examines usage frequency, motivations for using quick-commerce platforms, spending patterns, impulse purchases, and perceptions of prices and economic benefits. The second research question is explored through secondary research and policy analysis, drawing on government publications, industry reports, academic studies, company disclosures, and relevant legal and regulatory developments to examine gig workers' earnings, working conditions, and access to social security. By combining these two approaches, the study aims to understand how quick commerce creates value for consumers while also examining the economic risks and welfare challenges faced by the workers who support its operations.

Consumer demand for convenience drives quick-commerce platforms to compete through faster deliveries, wider product availability and competitive pricing. To meet these expectations, platforms rely on efficient logistics, dark stores and delivery workers who enable rapid order fulfilment. However, the pressure to reduce delivery times and operating costs can create challenges for workers through income uncertainty, work-related risks and performance-based incentives. While consumers benefit from convenience and platforms gain revenue and market share, delivery workers may bear a disproportionate share of the costs and risks. This highlights the importance of ensuring that the economic gains generated by quick commerce are distributed more equitably among consumers, platforms and workers.

METHODOLOGY

Study Design

This study adopts a descriptive and analytical research design to examine two dimensions of India's quick-commerce industry: consumer behaviour and gig-worker

welfare. A mixed-source approach combining primary and secondary data is employed. Primary data, collected through a structured online survey, are used to analyse consumers' usage patterns, motivations, spending behaviour, impulse purchases, and perceptions of quick-commerce platforms. Secondary data from government publications, industry reports, academic studies, company disclosures, and policy documents are used to examine gig workers' earnings, working conditions, and access to social security. The study uses descriptive statistics to summarise the survey findings and qualitative analysis of secondary sources to understand the broader economic and policy implications of quick commerce. The findings are interpreted within the limitations of the available data and do not establish causal relationships.

Study Participants

Primary data were collected through a structured online survey administered using Google Forms. The survey received responses from 74 participants selected through convenience sampling. Approximately 51% of the respondents were school students(13-18 years old), And the other approx 49% Were college students and Employees(18-30 years old). The inclusion of respondents from different backgrounds enabled the study to capture diverse perspectives on convenience-driven consumption.

Data Collection Methods

The study relied on both primary and secondary sources of data.

- **Primary Data:** A structured questionnaire consisting mainly of closed-ended questions was administered through Google Forms. The survey explored respondents' usage and spending behaviour on quick commerce platforms, with particular emphasis on delivery speed, convenience, frequency of ordering, impulse purchases, price sensitivity

- **Secondary Data:** Secondary information was collected from company disclosures and annual reports, industry and consulting reports, government publications, news articles, academic journals, and published research papers. These sources were used to analyse growth trends in quick commerce, the business models of leading platforms, and the broader context of the gig and platform economy in India, including the role of delivery workers.

The combination of primary and secondary data allows the study to capture both real consumer perspectives and documented market-level trends.

Data Analysis

The quantitative survey data were analysed using descriptive statistical techniques. Frequencies and percentages were calculated to summarise respondents' spending habits, motivations for using quick commerce, and perceptions of convenience. As the study is descriptive in nature, no causal relationship between convenience and spending is established. The findings from the primary survey were then compared with secondary evidence to identify recurring patterns, validate survey responses, and provide a broader understanding of how convenience shapes consumer behaviour in the platform economy.

Limitations

The sample size is small and was drawn through convenience sampling, with a majority of respondents being students. The findings therefore reflect the views of this group and cannot be generalised to all quick commerce consumers in India.

Ethical Considerations

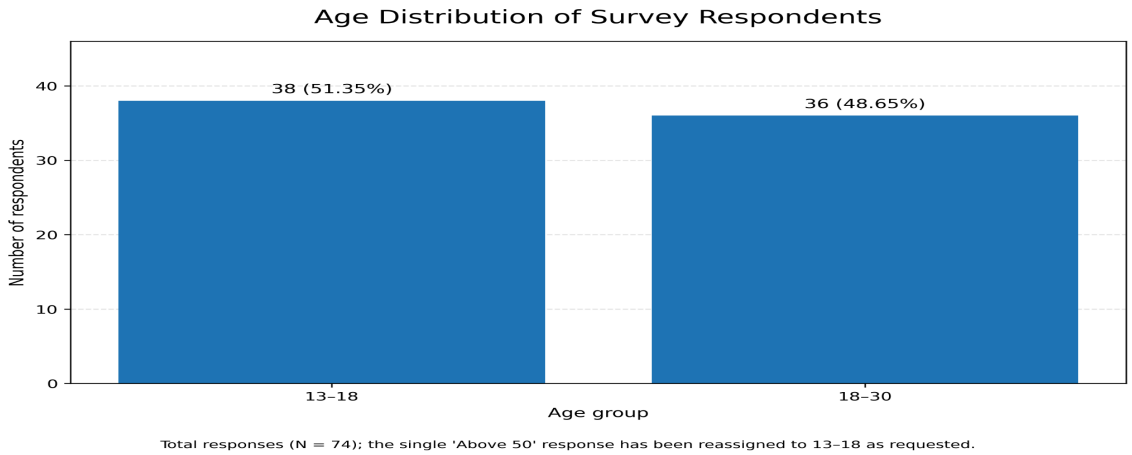

The study adhered to accepted ethical research standards. Participation in the survey was voluntary, and informed consent was obtained from all respondents before data collection. Participants were assured of anonymity and confidentiality, and no personally identifiable information was collected. The data were used solely for academic purposes, and respondents were free to withdraw from the survey at any stage.

RESULT

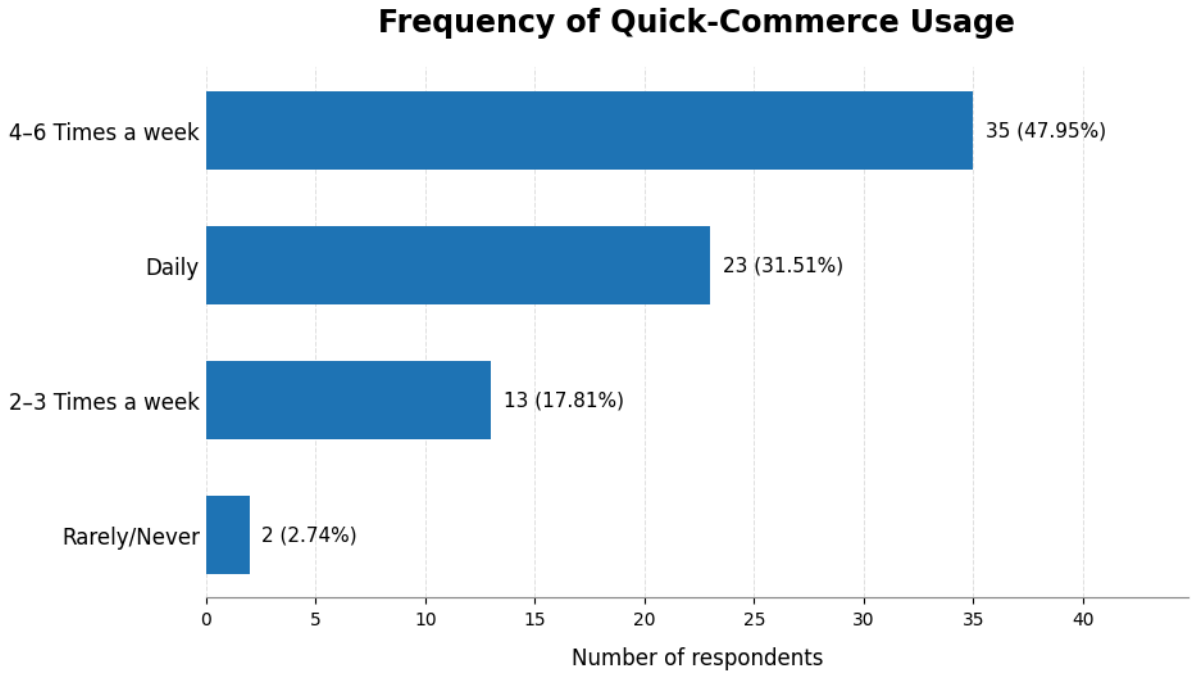

The findings of the study are presented in two sections: Primary Data Results and Secondary Data Results.

Primary Data Results

The primary data were collected through a structured Google Forms questionnaire comprising multiple-choice questions designed to examine public perceptions of the Convenience and Usage of the Ecommerce Platform in day to day life. The survey received responses from **74 participants**, and the key findings are presented below.

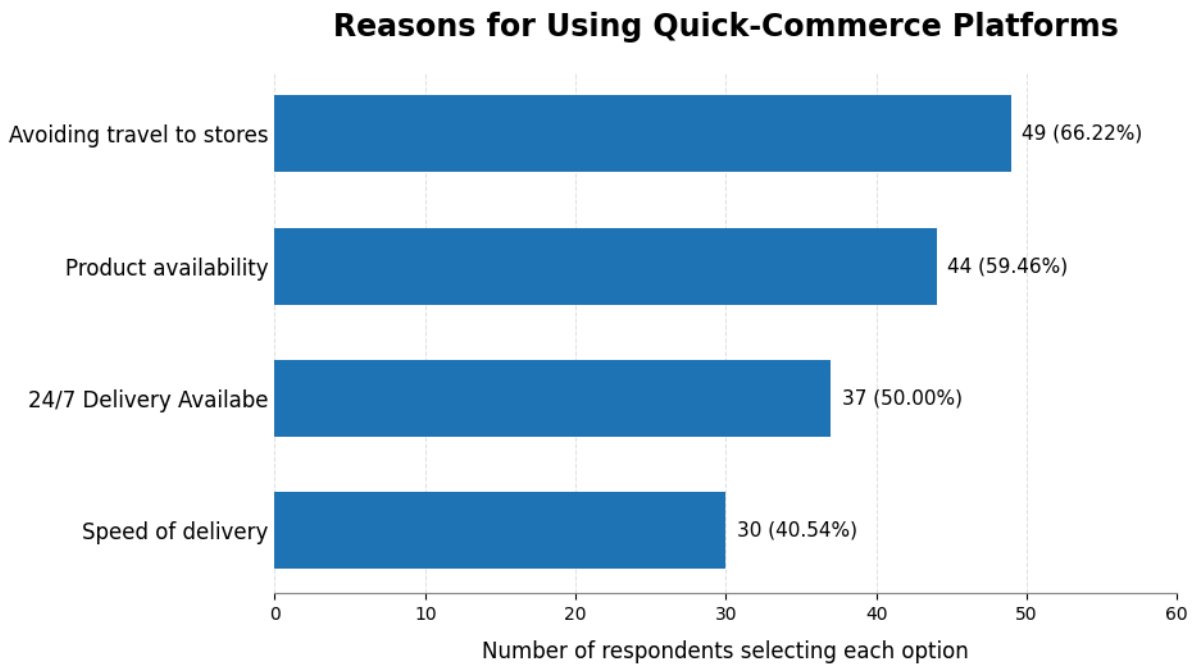

Q1 How frequently do you use quick-commerce platforms (Blinkit, Zepto, Instamart, etc.)?

results indicate that 47.95% of respondents use quick-commerce platforms 4–6 times a week, making it the most common usage frequency. Meanwhile, 31.51% reported using these platforms daily, while 17.81% use them 2–3 times a week. Only 2.74% of respondents reported rarely or never using such platforms. Overall, the responses indicate frequent usage of quick-commerce platforms among the surveyed participants

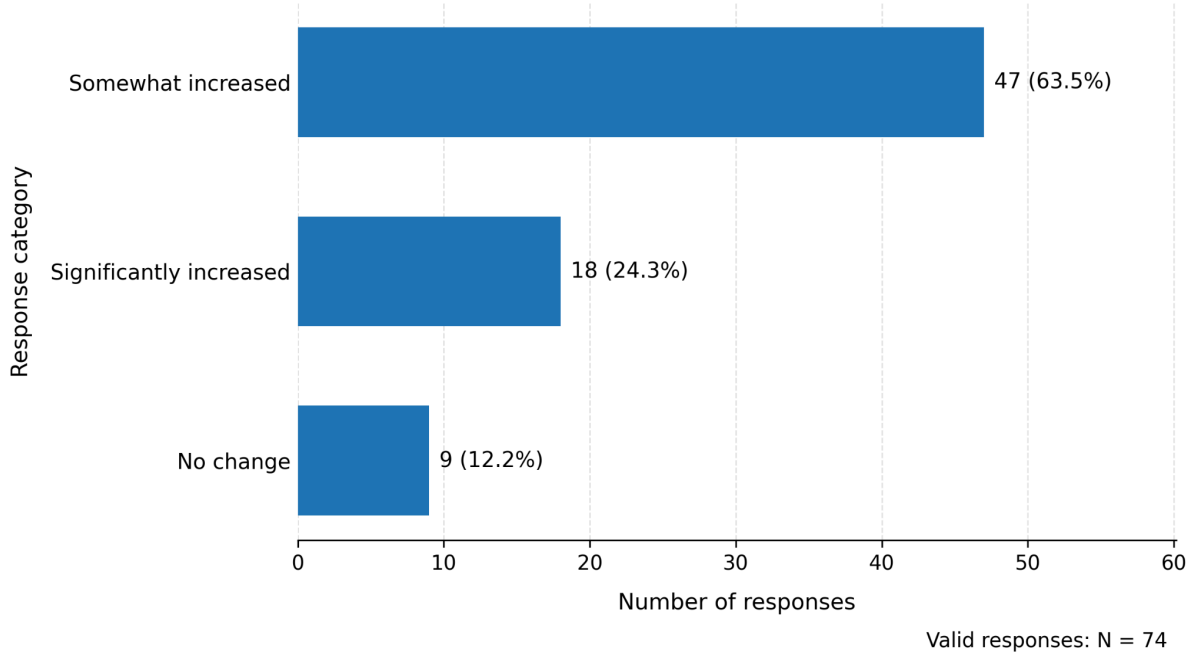

Q2 What is your main reason for using quick commerce? (Multiple Select Question)

Total respondents: N = 74 | Multiple selections permitted; percentages do not sum to 100%.

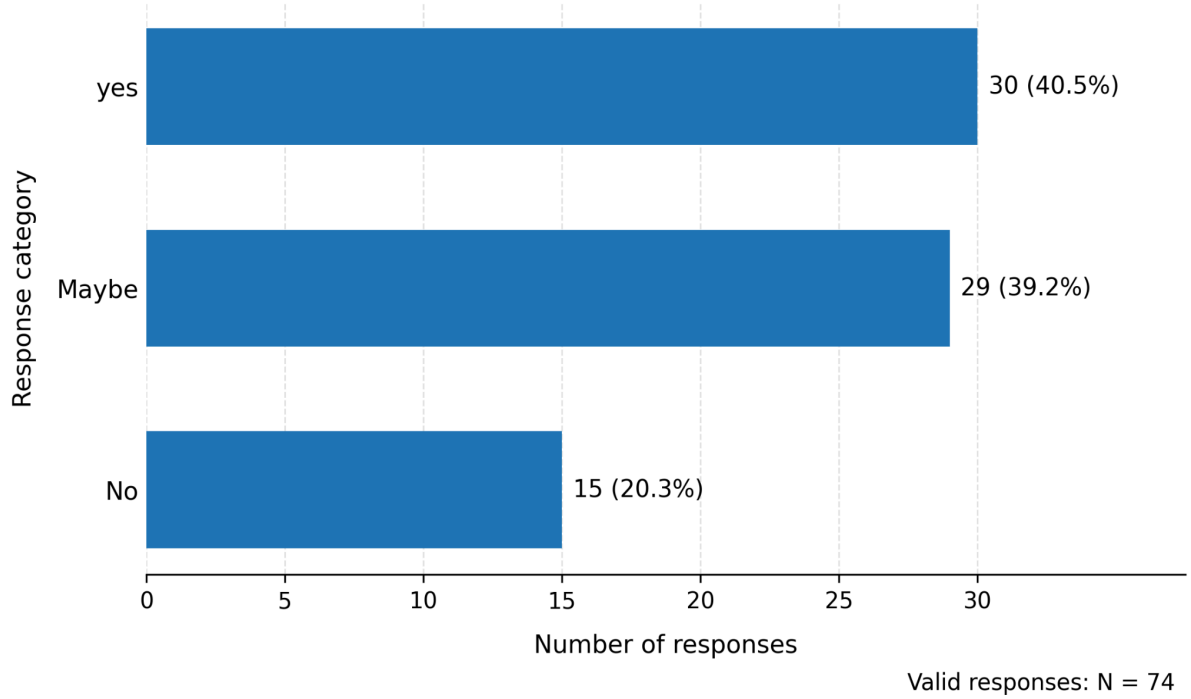

findings indicate that avoiding travel to physical stores was the most frequently selected reason for using quick-commerce platforms, accounting for 66.22% of respondents. Product availability was selected by 59.46%, while 50% identified 24/7 delivery availability as a reason. Speed of delivery was selected by 40.54% of respondents. These findings highlight the importance of convenience, accessibility and product availability in consumer preferences regarding quick-commerce platforms.

Q3 Has quick commerce increased your overall spending on products such as groceries, snacks and household items?

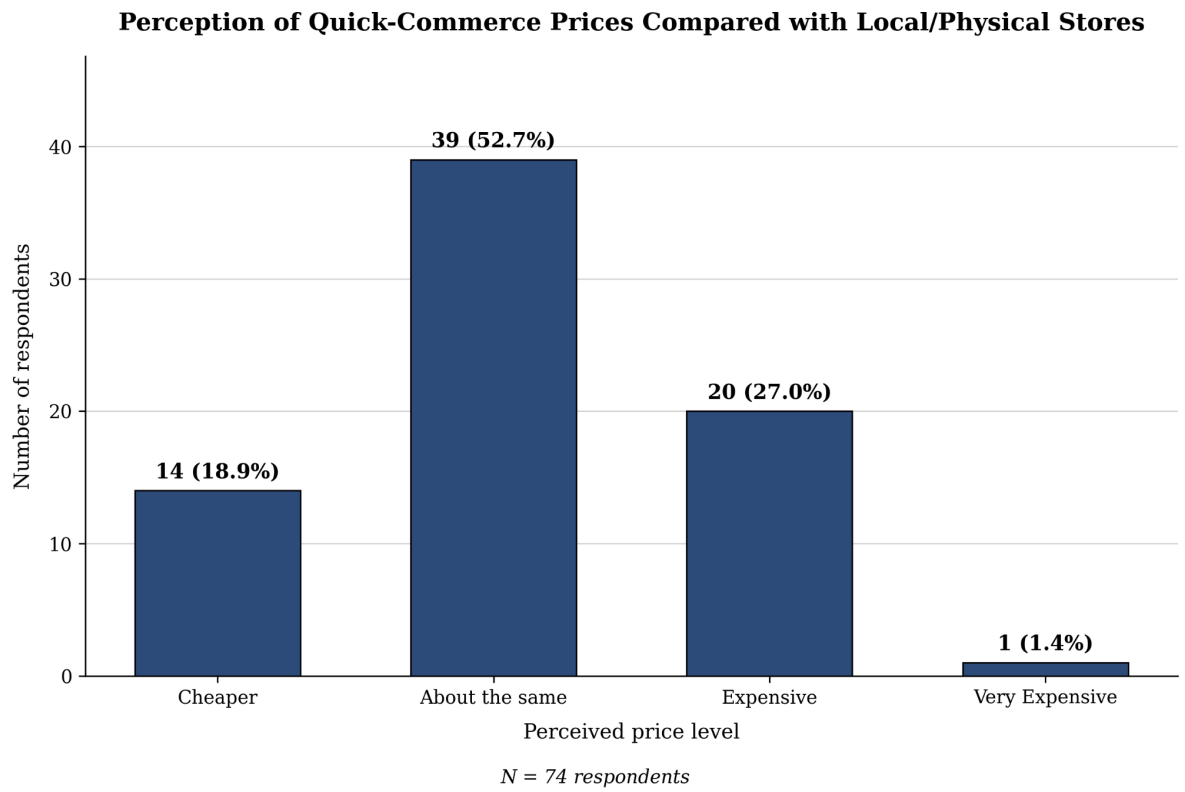

The largest category was “Somewhat increased,” selected by 47 respondents (63.5%). A further 18 respondents (24.3%) reported “Significantly increased,” while 9 respondents (12.2%) reported “No change.” Overall, 87.8% of respondents selected one of the two categories indicating an increase. These results describe the distribution of reported responses and do not, by themselves, establish the cause or magnitude of the perceived increase.

Q4 Have you ever purchased something through quick commerce that you did not originally intend to buy?

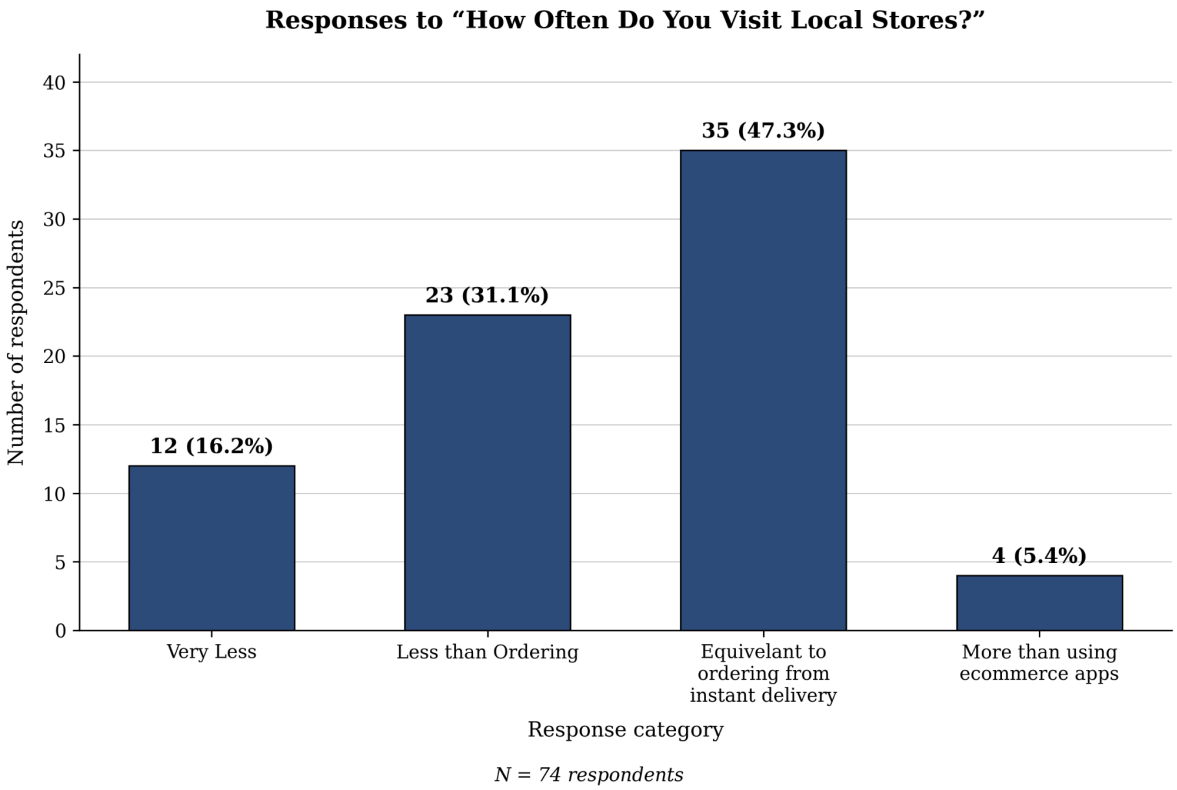

the most frequent response was “yes,” selected by 30 respondents (40.5%). A closely comparable 29 respondents (39.2%) selected “Maybe,” while 15 respondents (20.3%) selected “No.” The results indicate that “yes” was the most common response, although the proportion selecting “Maybe” was only 1.3 percentage points lower. These findings describe the response distribution without establishing the reasons behind the respondents’ choices.

Q5 Compared with local/physical stores, how do you find quick-commerce prices?

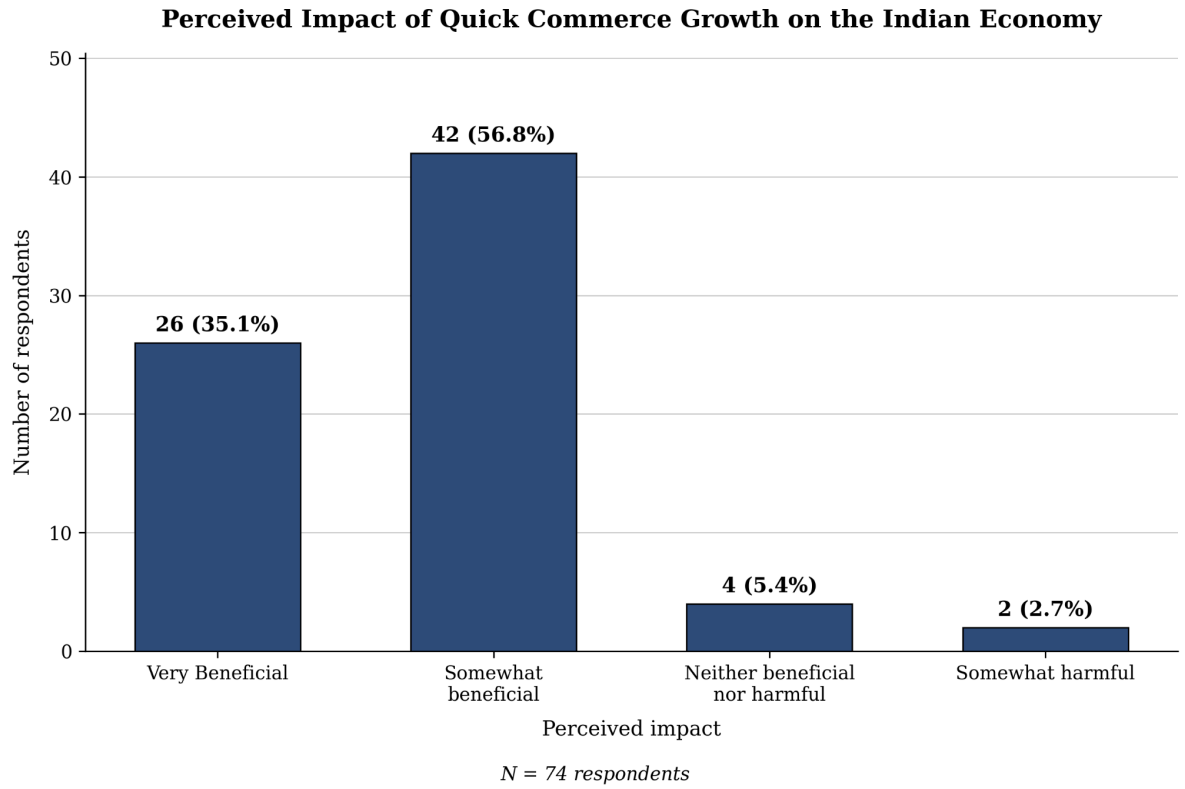

It Shows how 74 respondents rated quick-commerce prices compared with local or physical stores. Just over half (52.7%) found the prices about the same, while 28.4% rated them as expensive or very expensive. 18.9% found them cheaper. Overall, most respondents considered quick-commerce prices comparable to local stores, and more respondents rated them higher than lower.

Q6 How often do you visit local stores?

It shows how 74 respondents described their visits to local stores. The largest group (47.3%) reported visiting local stores about as much as they order from instant delivery. 31.1% (n = 23) reported visiting less than they order, and 16.2% reported visiting very little. Only 5.4% reported visiting more than they use e-commerce apps. In total, 47.3% reported visiting local stores less than they order online.

Q7 Overall, do you think the growth of quick commerce is beneficial or harmful to the Indian economy?

It shows how 74 respondents rated the growth of quick commerce in terms of its impact on the Indian economy. Most respondents (56.8%,) considered it somewhat beneficial, and 35.1% considered it very beneficial. Together, 91.9% rated the growth as beneficial to some degree. 5.4% considered it neither beneficial nor harmful, and 2.7% considered it somewhat harmful. Overall, the large majority of respondents viewed the growth of quick commerce as beneficial to the Indian economy.

Economic Interpretation of the Survey Findings

The survey findings can be interpreted through the economics of transaction costs and behavioural economics. Quick-commerce platforms reduce the time and effort associated with purchasing everyday products by allowing consumers to order from their phones instead of travelling to physical stores. This reduction in non-monetary costs may increase the attractiveness of online purchasing, particularly when consumers value time and immediate availability.

The finding that 87.8% of respondents reported an increase in spending suggests that some consumers perceive quick commerce as being associated with higher expenditure. Additionally, 40.5% reported making unplanned purchases, while 39.2% selected “Maybe.” These responses are consistent with the possibility that

convenient access and reduced purchasing friction may influence buying decisions. However, the survey does not establish whether convenience directly caused the reported spending increases or whether other factors, such as income, household needs, discounts and purchasing frequency, contributed to these responses.Even today this effect has put a major effect on more than 67% kiryana Stores in which there sales has declined and mostly people purchase goods from Ecommerce for there delivery and cashbacks. This is the reason due to which 47% of Quick commerce users have reduced purchases from kiryana stores and 2 lakh kiryana stores closes after Quickcommerce(Money Control Survey)

The findings should therefore be interpreted as evidence of reported consumer perceptions rather than a causal estimate of the effect of quick commerce on expenditure

Secondary Data Results

The gig and platform economy, often described as an economics of convenience, is among the fastest-growing segments of India's labour market (Government of India, 2020) . The Code on Social Security, 2020 defines a "gig worker" as a person who performs work or participates in a work arrangement and earns from such activities outside of a traditional employer-employee relationship. Within this broad category, a platform worker is one who accesses customers through an online platform, and the platform itself is treated by the Code as an aggregator, a digital intermediary connecting a buyer with a service provider (Government of India, 2020) .
Ride-hailing, food delivery, home services and, increasingly, quick commerce all operate on this model. For consumers, the appeal is speed and ease. For workers, it is flexible entry and immediate income. For firms, it is a scalable system that matches supply and demand in real time without the fixed costs of permanent employment.

Term	Definition	Source
Gig Worker	A person who performs work or participates in a work arrangement and earns from it outside a traditional employer-employee relationship	Code on Social Security, 2020 (Government of India).
Platform worker	A gig worker who accesses customers through an online platform to provide services for payment	Code on Social Security,

		2020 (Government of India).
Platform / aggregator	A digital intermediary or marketplace connecting a buyer with a service provider	Code on Social Security, 2020 (Government of India).

Table 1: Key Definitions

The scale of this shift is considerable.NITI Aayog, 2022 report estimated that the gig workforce would expand to 2.35 crore by 2029-30, up from roughly 77 lakh workers in 2020-21, rising from 2.6% to 6.7% of the non-agricultural workforce . A study by the V.V. Giri National Labour Institute projects that the sector could employ 62 million workers by 2047, about 15% of the non-agricultural workforce. Boston Consulting Group, 2021 study further estimates that gig work could serve up to 90 million non-farm jobs and add roughly 1.25 percent to India's GDP over the long term, a projection of potential rather than a measured contribution. These figures show that gig work is no longer marginal but a significant part of India's economic structure.

Indicator	FIgure	Year	Source
Gig Workers	77 lakh (2.6% of non-agri workforce)	2020-21	NITI Aayog (2022)
Projected gig workforce	2.35 crore (6.7% of non-agri workforce)	2029-30	NITI Aayog (2022)
Projected gig workforce	62 million (about 15%)	2047	V.V. Giri National Labour Institute
Potential jobs and GDP effect	Up to 90 million jobs; about 1.25% of GDP	Long Term	Boston Consulting Group-2021

Table 2: Size and projections

Quick commerce has become the most visible face of this convenience economy. Swiggy's draft red herring prospectus reported 538 dark stores in June 2024, and by July 2025 its Instamart service operated in 127 cities. The promise of ten-minute delivery turned speed into a competitive weapon, but it also raised questions about the pressure placed on workers. On 13 January 2026, Labour Minister Mandaviya had companies such as Blinkit, Swiggy Instamart and Zepto remove "10-minute delivery" branding from their communications. Workers' unions held strikes on 25 and 31 December 2025 in about 22 cities, claiming roughly one lakh participants, and demanded an end to ten-minute delivery and a minimum monthly income of ₹40,000. These participation figures are union claims rather than independently verified counts.

Theoretically, platforms lower transaction costs by matching supply and demand in real time, offering consumers speed and workers flexibility. Yet this efficiency rests on classifying workers as independent partners rather than employees. This shifts risks such as income volatility, accidents and illness onto individuals, while algorithmic control over ratings, pay and task allocation limits real autonomy. Traditional social security, built around a stable employer-employee relationship, struggles to fit this triangular arrangement of worker, platform and consumer. The result is a form of work in which the firm captures the benefits of control while the worker bears the costs of independence.

The evidence on earnings suggests that flexibility does not always translate into security. IDInsight (2024) found that a gross ₹170 per hour falls to about ₹115 after costs, with roughly 32% lost to fuel and maintenance, while the average worker puts in about 51 hours a week and some as many as 95. An NCAER study of 924 food-delivery workers in 2022 found that real wages fell by 11%, to ₹11,963 a month. The Economic Survey 2025-26 reports that about 40% of gig workers earn under ₹15,000 a month. A 2024 survey of 2,000 workers across 40 cities by the delivery company Borzo found that 77.6% earned less than ₹2.5 lakh a year and 61% did not know their income-tax slab. Swiggy's own filing shows the payment per order falling from ₹59.23 in FY22 to ₹56.01 in FY24.

Indicator	Finding	Source
Hourly earning	₹170 gross falls to about ₹115 net; 32% lost to fuel and maintenance	IDInsight(2024)
Working hour	About 51 hours a week; some up to 95	IDInsight(2024)
Real wages	Fell 11%, to ₹11,963 per month (924 food-delivery workers)	NCAER(2024)
Low Income	About 40% earn under ₹15,000 per month	Economic

		Survey 2025-26
Annual Income	77.6% earn under ₹2.5 lakh; 61% don't know their tax slab (company survey, 2,000 workers, 40 cities)	Borzo(2024)
Payment per order	₹59.23 (FY22), ₹58.99 (FY23), ₹56.01 (FY24)	Swiggy DHRP
Women Participation	About 1% of delivery gig workers	NCAER-ILO
Digital banking	32% of men and 14% of women	NCAER-ILO
Fair Pay	2 of 11 platforms could show minimum-wage evidence	Fairwork India (2024)

Table 3: Earnings and working conditions

These conditions are not evenly shared. According to NCAER-ILO findings, women account for only about 1% of delivery gig workers, and the same research shows that 32% of men hold a digital banking account compared with 14% of women, a gap that directly affects access to digitally delivered benefits. Fairwork India's 2024 ratings found that only two of eleven platforms could demonstrate that workers earn at least the minimum wage after costs. Such findings indicate that the gains of the platform economy are distributed unequally among workers and between workers and firms.

Policy has begun to respond. The Code on Social Security was passed on 23 September 2020 and fully brought into force on 21 November 2025, five years later. The e-Shram portal, launched in August 2021, carried over 31 crore registrations by 1 December 2025, of which only about 5 lakh were gig workers, and links 14 welfare schemes. The Union Budget 2025-26 announced e-Shram identity cards and a ₹5 lakh PM-JAY health cover for about one crore gig workers, although a confirmed rollout and beneficiary count have not been found. The aggregator contribution of 1-2% of turnover, capped at 5% of payments to gig workers, has not yet been notified. Eligibility requires 90 days of work in the preceding year, a threshold unions want reduced to 60, and the National Social Security Board of about 31 members is advisory and does not adjudicate individual disputes.

Measure	Status
Code on Social Security, 2020	Passed 23 Sep 2020; fully in force 21 Nov 2025
e-Shram registration	Over 31 crore total; about 5 lakh gig workers

	(1 Dec 2025); 14 schemes linked
Aggregator contribution (1-2% of turnover, capped at 5% of payments)	Not yet notified
Eligibility	90 days' work in preceding year; unions seek 60
National Social Security Board	About 31 members; advisory only
PM-JAY ₹5 lakh cover for about 1 crore gig workers	Announced in Budget 2025-26; rollout not confirmed

Table 4: Policy implementation status

Registration alone does not deliver protection. IMPRI's 2026 commentary describes implementation in three stages, finding decent evidence on worker registration, partial evidence on aggregator compliance, and none on benefit delivery. The Code places obligations on "the aggregator" in the singular, leaving unclear how entitlements and liability are shared when a worker serves several platforms, such as a rider who works for one company in the morning and another in the evening. Legal commentary has described this as leaving workers "logged in, left out". Without a mechanism to combine contributions and entitlements across platforms, benefits cannot follow the worker.

States have moved ahead of the Centre, but in different directions. Rajasthan enacted the first gig worker law in 2023, with a cess of 1-2% and penalties of up to ₹50 lakh. Karnataka imposes a levy of 1-5% on platform commission and requires a human point of contact for workers. Bihar passed its law in August 2025, Jharkhand's received the Governor's assent on 18 December 2025, and Telangana has enacted its own law with a 1-2% welfare fee and a right for workers to seek information on automated decisions. Uttar Pradesh, Maharashtra and Delhi have no separate Act. The question of whether platforms are directly liable for worker accidents remains before the Supreme Court in IFAT v. Union of India, pending since 2021. Other jurisdictions offer contrasting approaches: the UK Supreme Court held in Uber v. Aslam (2021) that drivers are "workers", the European Union's 2024 Platform Work Directive creates a rebuttable presumption of employment with transposition due by 2 December 2026, and California's Proposition 22 preserved contractor status in exchange for limited benefits.

State	Key feature
Rajasthan (2023)	First state law; cess of 1-2%; penalty up to ₹50 lakh

Karnataka	1-5% levy on platform commission; human point of contact; grievance to Board within 14 days
Bihar (2025)	No right to form unions; data protection provisions
Jharkhand	Governor's assent 18 Dec 2025; minimum wage mandatory; penalty up to ₹10 lakh
Telengana	1-2% welfare fee; 20-member Board; right to information on automated decisions

Table 5: State Laws

Jurisdiction	Approach
United Kingdom	*Uber v. Aslam* (19 Feb 2021): drivers are "workers" with minimum wage and paid leave
European Union	Directive 2024/2831 (adopted 14 Oct 2024): rebuttable presumption of employment; transposition due 2 Dec 2026
California	Proposition 22 passed with 59% of the vote; upheld 25 July 2024; contractor status kept with limited benefits

Table 6: International Approaches

The secondary research highlights the importance of effective social security delivery, including the portability of benefits across platforms and states, coordination among institutions, and accountability in platform-based employment. These issues are examined through existing policy frameworks, legal developments, industry reports, and published research rather than through the primary consumer survey. The analysis therefore complements the survey findings by placing consumer convenience within the wider economic context of gig-worker welfare. Together, the two strands of research provide a broader understanding of the quick-commerce industry, considering both the benefits experienced by consumers and the working conditions and social protection challenges faced by delivery workers.

Results Conclusion -

The two datasets point in the same direction from different sides. On the consumer side, 91.9% of respondents regard quick-commerce growth as beneficial, and 66.2% use it mainly to avoid travel. On the worker side, secondary evidence suggests that the convenience consumers value is supported by long hours, falling per-order pay and incomplete social security. The study therefore finds that the benefits of quick commerce are widely recognised by consumers, while its costs are less visible to

them and fall mainly on workers. This gap suggests that consumer enthusiasm alone is not a sufficient measure of the industry's economic value.

Recommendations-

- **Kirana-platform partnerships.** Local stores could act as pickup or fulfilment points, or list on the platforms directly (similar to what ONDC aims to enable). Platforms gain wider coverage with lower dark-store costs, kiranas gain new demand, and consumers keep convenience. As seen in primary data
- **Awareness of the hidden costs.** survey shows 40.5% make unplanned purchases and 87.8% report higher spending. Simple tools such as order summaries, spending reminders, or "cart cooling-off" prompts could help, and platforms could offer them voluntarily.
- **Fair rest and hours.** Cap daily logged-in hours, given the 51-hour average and 95-hour extremes in your data.
- **Accident insurance and health cover** paid by the platform, not the worker.

CONCLUSION

The growth of India's quick-commerce industry reflects a significant change in consumer behaviour, driven by convenience, speed, and easy access to products. The findings of this study indicate that consumers primarily use quick-commerce platforms to avoid travel, access a wider range of products, and reduce the time and effort required for shopping. The survey also reveals that 87.8% of respondents reported an increase in spending after using these platforms, while 40.5% admitted to making unplanned purchases. These findings suggest that the convenience of quick commerce may encourage additional spending and impulse buying, although the self-reported data do not establish a direct causal relationship. At the same time, most respondents considered quick-commerce prices comparable to those of local stores and viewed the industry as beneficial to the Indian economy.

However, the economic benefits of quick commerce must be considered alongside its implications for gig workers. Although the industry creates employment opportunities and supports rapid delivery services, questions concerning earnings stability, working conditions, delivery-time pressure, and access to social security remain important. The expansion of platform-based employment should therefore be accompanied by greater attention to worker welfare and appropriate social protection. The convenience experienced by consumers should not come at the cost of insecure or inadequate working conditions for those who provide these services.

Overall, quick commerce represents both an opportunity and a challenge for the Indian economy. It offers consumers greater convenience and contributes to the transformation of retail markets, but it may also influence spending habits and raise concerns about the welfare of gig workers. A sustainable model of growth requires a balance between consumer satisfaction, business efficiency, and fair working

conditions. While this study provides useful insights into consumer perceptions and spending behaviour, its relatively small, convenience-based sample limits the generalisation of the findings. Further research using larger and more representative samples, along with detailed data on gig workers' earnings and working conditions, would help develop a more comprehensive understanding of the industry. Ultimately, the long-term success of quick commerce in India will depend not only on how quickly goods are delivered, but also on how equitably the economic benefits are shared among consumers, businesses, and workers.
